Appendix	8

Product Narrative

In the contemporary whirlwind academic environment, where deadlines, extracurricular activities, and part-time jobs tirelessly vie for attention, it has emerged as an increasing difficulty to maintain meaningful relationships. Undergraduate students forming lifelong friendships, graduate students developing future professional networks, and doctoral students managing rigorous research with personal life are all familiar with the pain of drifting apart. Despite the best intentions of staying close, the routine of daily life gets them bogged down with missed opportunities: forgotten birthdays, sporadic catch-ups, and a growing drift from those who matter.

The Problem

For the typical student, the problem is not absence of interest but distraction. Students manage to get in touch with only approximately 50% of their close friends in a month, well below the level of contact they would like to have. This is a deficit not just of missed messages, but of missed opportunities to share experiences, support one another through academic and personal crises, and form networks that will last a lifetime. Adding to the dilemma is the volume of contacts, and the divided state of the tools that are available today, students must manage hundreds of connections.

Social media sites and digital calendars remind, but lack the subtlety to place important interactions in order of priority. Instead of turning these momentary contacts into lasting connections, students find themselves caught in a cycle of sporadic, anonymous messages that never manage to bridge the gap between intent and action.

Our Solution

Context—a revolutionary mobile app crafted with the particular struggles of college students to maintain relationships in mind. Context is not another social application, but a relationship management tool through which the digital divide between connectivity and actual human connection is closed intuitively.

Context operates by blending unobtrusively into a student's pre-existing contact list and communication media. Using on-device AI, the app sorts contacts into groups like "Family," "Close Friends," "Friends," "Professional," and prioritizes those relationships that need more attention. It learns from users' interaction history, measuring how often users speak to one another, monitoring special dates, and even sensing when a conversation is going awry. With such insights, Context provides timely, personalized reminders for students to call, catch up, or even hang out. The app also has an automatic digital scrapbook that collects shared memories and previous conversations, giving context to every interaction that makes it more special. By collecting these digital keepsakes, Context turns routine check-ins into moments of reminiscence and reconnection. Taking it a step further, Context even recommends shared experiences. Whether it is an invitation to an on-campus event, coffee at a new cafe, or just

organizing a study group, these suggestions are intended to assist users in bringing online activity offline.

Market Opportunity and Business Reason

Context's market is as unlimited as it is unexploited. With more than 18 million college students going to college every year in the United States alone, and a similar number abroad, the market opportunity is very large. They are digitally native technology-enabled youth who utilize technology to perform nearly everything in their lives but are under-served by current relationship management offerings. The number of possible users in itself presents an enormous opportunity for ongoing revenue, especially with a scalable usage-based pricing structure.

Context will provide its basic features free of charge, making it universally adopted by students. In addition to this free version, premium features like AI-powered reminders, bespoke experience booking, and online scrapbooking will be provided on a pay-per-use basis.

This value-for-pay model is set up to be directly linked to value received: students only pay after they actually receive value from premium services, and it provides an equitable, transparent, and flexible revenue stream. By doing this, Context not only addresses a key need but does it in a financially prudent manner that also promises high returns.

Competitive Advantage Although there is a variety of tools that address some elements of relationship management, ranging from social media websites and electronic calendars to contact management applications, none provide the integrated, context-sensitive solution that Context provides. Current solutions tend either to focus too heavily on networking or on informal socializing, without providing the sophisticated, personalized assistance that students today need to sustain more meaningful relationships. Context is unique in that it weds cutting-edge AI to an intuitive interface that renders relationship maintenance simple. By automatically sorting contacts, learning from communication patterns, and proactively providing actionable insights, Context not only reminds its users to follow up but also teaches them how to do so meaningfully. This combination of competencies presents a compelling value proposition: converting lost connections into opportunity for ongoing, meaningful interaction.

Moreover, by tying its pricing scheme to real usage and value, Context once again demonstrates its dedication to delivering understandable, quantifiable value to all.

Impact and Future Vision

For students, Context's impact is great. By bridging isolated online interactions to real relationships, the app creates a stronger feeling of community and support, a vital element in both personal well-being and educational success. Improved relationship management can lead to richer social experiences, enhanced emotional support during times of pressure, and even improved career networking upon graduation.

From a business perspective, the successful take-up of Context in the college market forms the foundation for longer-term growth. As students graduate and move into the work context, they carry with them the value of maintaining close, personal networks. This presents the opportunity to evolve Context into a comprehensive relationship management system that grows to accommodate the evolving needs of users over time. The early emphasis on college students is only the beginning of a long-term effort to enable people to create and maintain satisfying relationships for a lifetime. Conclusion Context is more than an app; it is a strategic solution to a ubiquitous modern dilemma. It solves the inevitable chasm between a need to stay connected and the demands of a frenetic, digitally disconnected existence. To business plan writers, entrepreneurs planning to go after new opportunities, Context is an attractive proposition: a product for a sizable, well-defined market, established on scalable technology, and supported by a revenue model that connects cost with value. By investing in Context, you're not just investing in a product that will change how millions of students handle relationships, you're unlocking the potential for long-term, sustainable growth in a ready-to-be-innovated and dynamic market. In a global village where relationships are more important than ever before, Context empowers users to reclaim the human touch in their relationships so that no meaningful connection is ever lost. This is the future of relationship management, a future in which technology is a bridge, not a barrier, to human connection.

1. Customer Problem Space

1. Fertile Land

- Relationships

2. Customer

- College Student

3. Job To Be Done

- Maintain Relationships

4. Outcomes

Since this is a problem I face in my own life on a daily basis, the numbers have been estimated based on my personal experiences. It was difficult to find official numbers online, and may require primary research to validate the results

- Outcome 1:
 - Actual Outcome Statement: The average close friends contact rate per month is 50%
 - Desired Outcome Statement: The average close friends contact rate per month will 75%
 - Measurement Method: Keep track of when user last contacted friends from "close friends list"
- Outcome 2:
 - Actual Outcome Statement: The Average Conversation Duration is 5 minutes
 - Desired Outcome Statement: The Average Conversation Duration will be 15 minutes
 - Measurement Method: Track length of conversations with contacts
- Outcome 3:
 - Actual Outcome Statement: The average forgotten birthday rate is 30%
 - Desired Outcome Statement: The average forgotten birthdays rate will be 10%
 - Measurement Method: Track whether the user contacts their contact after receiving a birthday notification

5. Problem

- a. Gap: There is 25% gap between the average percentage of close friends contacted per month and the desired average percentage of close friends contacted per month
- b. Causes:
 - a. Busy schedules
 - b. Too many people to be contacted
 - c. Forget to reply to messages
 - d. Run out of conversations after a long time apart
 - e. Too many notifications
 - f. Messages are organized by time

- g. Want to contact friend but get distracted by something else

6. Customer Journey Map

Appendix (Page 10)

7. Use Cases

- Relationships with family members
- Professional relationships
- Relationships with all friends
- Relationships with close friends

8. Problem Sizing

1. No. of Actors: 3.2 million graduate students (*Coe - characteristics of postsecondary students*)
2. Frequency: The average number of close friends is 3.38 (Goddard, 2023).
3. Duration: Assuming each graduate student forgets to contact 2 out 4 close friends every month, the amount of close friends not contacted in a year per person is 24.

The problem size is 76.8 million close friends being forgotten or left without contact by their close friend every year

9. Problem Category

- Friendship Engagement Problem

10. Problem Statement

Due to busy schedules and excessive distractions, graduate students forget to contact close friends at a rate of 50% per month, leading to 24 non-contacted close friends per graduate student annually. This results in approximately 76.8 million close friends being forgotten or left without contact by their close friends every year.

2. Market Space

1. Overall Market

Market Name: College Relationship Maintainers

In 2024, there were approximately 18.6 million students enrolled in college across various degree levels (Undergraduate, Master's, Doctorate, etc.). The number of college students in the US is steadily increasing year-over-year, however, the rate of increase has slowed down massively in recent years with people opting for other non-traditional avenues for education post graduation from highschool.

2. Total Addressable Market (TAM)

Assumptions:

- Target Market: College students using Context for relationship management, estimated at 10 million users.

- Usage Pattern:
 - Contacts: On average, each user manages 200 contacts. The first 100 contacts are free, meaning each user averages 50 extra contacts.
 - Automated Experience Bookings: Each user makes, on average, 2 bookings per month.

Revenue Calculations:

- Extra Contacts Revenue: each extra contact beyond the first 100 contacts is charged at 5 cents per month.

$$100 \text{ extra contacts} \times \$0.05 = \$5.0 \text{ per user per month}$$
- Automated Experiences Booking Revenue: Each booking incurs a \$1.00 charge.

$$2 \text{ bookings} \times \$1.00 = \$2.00 \text{ per user per month}$$
- Total Monthly Revenue Per Users:

$$\$5.0 \times \$2.00 = \$7.00 \text{ per user per month}$$
- Annual Revenue Per User:

$$\$7.0 \times 12 = \$84 \text{ per user per year}$$

Overall TAM:

For 10 million users, the total annual revenue potential is:

$$10,000,000 \times \$54 = \$540 \text{ million per year}$$

3. Market Segmentation

The market will be segmented into 3 main groups:

Academic Level:

- Undergraduate
 - Undergraduate students tend to socialize more than other types of college students. There are approximately 16 million undergraduate students in the US (NCES 2023). Which makes the potential number of actors in the market segment 15.5 million students. This market segment could be broken down further into either field of study or involvement in greek life or clubs and other organizations.
- Graduate
 - This segment includes students in master's programs in the US. It also includes people enrolled in professional masters programs. There are approximately 1.6 million students enrolled in master's programs in the US (NCES 2023). Similar to undergraduate and master's students this segment can be broken down by field of study.
- Doctoral
 - This segment includes students involved in doctoral programs throughout the US. This segment consists of approximately around 1 million students. Similar to undergraduate and doctoral students this segment can be broken down by field of study.

Social Engagement Orientation:

- Highly Engaged (actively maintain a broad network of close relationships)

- Moderately Engaged (struggle to keep up but value maintaining relationships)
- Less Engaged (often fall behind on staying in touch)

Tech Adoption Level:

- Early Adopters (quick to try new apps and digital solutions)
- Early Majority (adopt technology after initial success is shown)
- Late Majority (prefer simple, familiar tools and may be resistant to complex new solutions)

4. Target Market Profiles

Social Connectors:

Academic Level: undergraduate

Social Engagement Orientation: Highly Engaged

Tech Adoption Level: Early Adopters

Estd. No. of Actors: 10 million undergraduate students (assuming 60-65% are digitally active and lead active social lives)

Disconnected Undergraduates

Academic Level: undergraduate

Social Engagement Orientation: Less Engaged

Tech Adoption Level: Early Majority

Estd. No. of Actors: 6 million undergraduate students (assuming 60-65% are digitally active and but do not lead active social lives)

Busy Grad Professionals

Academic Level: graduate

Social Engagement Orientation: Moderately Engaged

Tech Adoption Level: Early Majority

Estd. No. of Actors: 2.6 million graduate students

5. Competition

Competitor 1: Manual Contact Reminders (Manual Method Competitor)

Examples:

- Paper Planners (to remind oneself to contact friends)
- Digital Calendars/Reminders (e.g., Google Calendar, Apple Reminders)

Competitor 2: Social Media Platforms (Indirect Competitors)

Category: Social Media Platforms

Examples:

- Facebook, Instagram by Meta
- Snapchat by Snap Inc.
- iMessage by Apple
- WhatsApp by Meta
- Telegram

Competitive Positioning:

Social media platforms automatically remind people about upcoming birthdays and occasional “memories” (in the case of Snapchat) but are primarily designed for broad social sharing rather than targeted, proactive relationship maintenance. The notifications can be overwhelming or easy to ignore in the context of busy student life. Furthermore, these apps are targeted towards growing the number of connections rather than strengthening and developing existing ones.

Competitor 3: Dedicated Relationship Management Apps (Direct Product Competitors)

Brand Name: Cloze Relationship Management

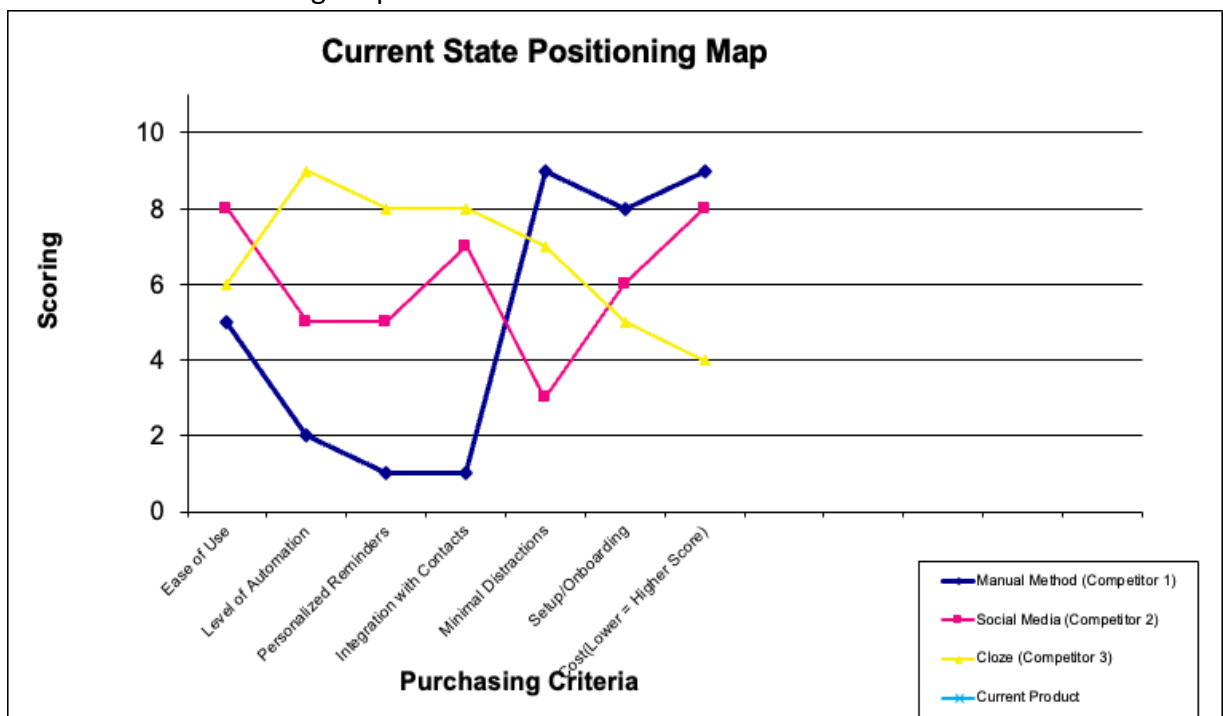

Company: Cloze Inc.

Competitive Positioning:

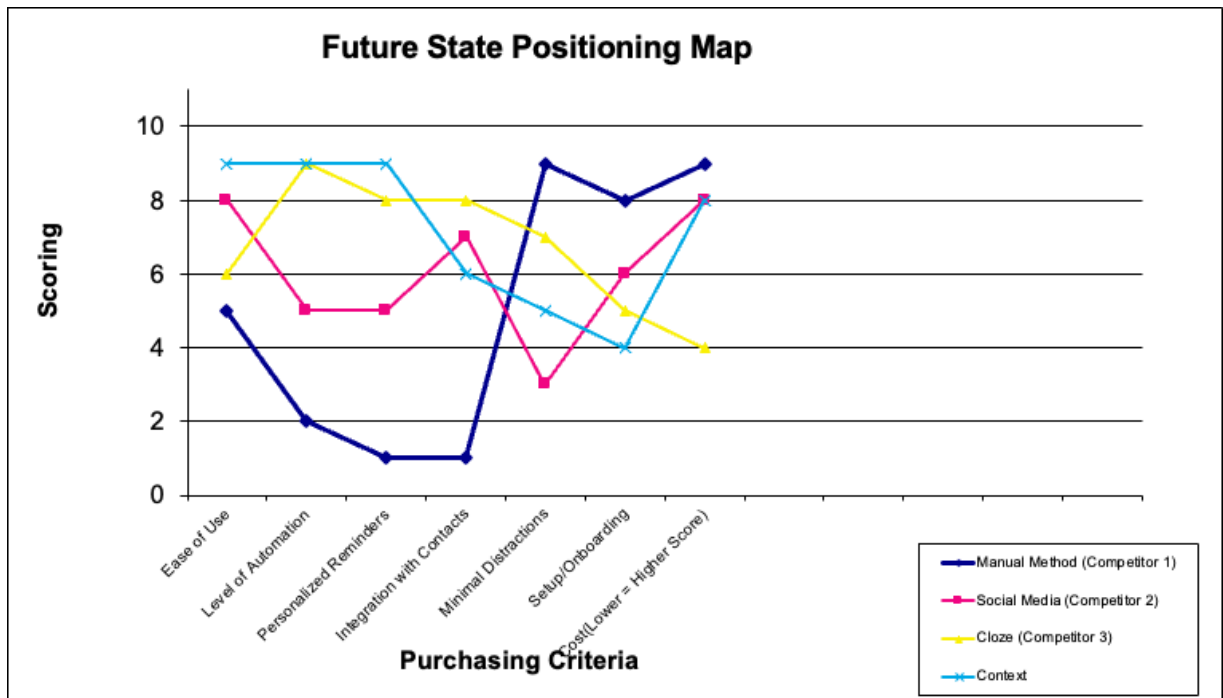

Cloze is an intelligent contact management tool that not only consolidates previous communications but also provides automated follow-up reminders. However, it is more business-oriented and may not be an intuitive enough solution for college students seeking a more simple and personalized solution.

6. Positioning Analysis

a. Current State Positioning Map

b. Future State Positioning Map

c. Position-to-Own
Manage Friendships. Automate Everything

7. Market Focus Decision

Market Segment and Niche:

The targeted segment will be the Social Connectors segment. This segment consists of undergraduate students who are highly engaged in maintaining their relationships, are digitally active, and quick to adopt new technologies. The estimated market size for this segment is around 10 million undergraduate students.

Position to Own:

Automate relationship maintenance while preserving the personal touch that Social Connectors Value.

Problem to Solve:

Even though Social Connectors are highly engaged and digitally active, they can still miss opportunities to nurture their close relationships, especially since these people have many different friend groups, making it even more difficult to nurture close relationships and keep track of all the people they meet.

3. Solution Space

1. Product Focus Decision

1. Product Name: Context
2. Purpose: Manage Relationships
3. Product Category: Social Media Apps
4. Main Attributes
 - Relationship Categorization: The app categorizes contacts into family, close friends, and friends.
 - Automated digital scrapbook: Initially, users manually input key details about their shared history, which then evolves into an automated digital scrapbook.
 - Automated Context Tracking and Reminders: Context periodically reminds you to reconnect, providing brief summaries of previous conversations, and tracks important dates (birthdays, anniversaries) and memories (similar to Snapchat memories).
 - Location Sharing: Location-sharing tool akin to Apple's Find My.
 - Text Aid: AI guided text suggestions to finish replying to messages.
 - Automated Experiences Booking: AI-driven suggestions for new shared experiences, even facilitating bookings using an AI agent.

5. Properties

- Native iOS and Android App

6. Key Technology

- AI based relationship context tracking
- Automated contact reminders
- Location Sharing
- AI agent to book events based on shared experiences

7. Operating Requirements

- iOS device with iOS 15 or higher
- iPhone 15 or higher
- Android phone

8. How it Works

- The user adds contacts that they want to maintain relationships with
- User categorizes contacts into, Family, Significant Other, Close Friends and Friends
- The user has the option to add relationship history, pictures and memories they remember for each relationship. AI analyzes the input to understand the context of each relationship.
- Users can begin chatting with their friends
- The on device and secure AI keeps track of all the conversation and evolving context of each relationship.
- The user gets periodic notifications to message people if not contacted in some time. Users also get reminders to reply to messages.
- If it has been a long time since the last conversation the users also get a brief summary of the context of their last conversations.
- User gets a list of important messages within the context of each relationships

- If users are planning to meet, the on-device AI keeps track of their shared interests and gives suggestions as well as booking the event or experience if required. AI also looks at calendars to suggest free time for the two individuals.

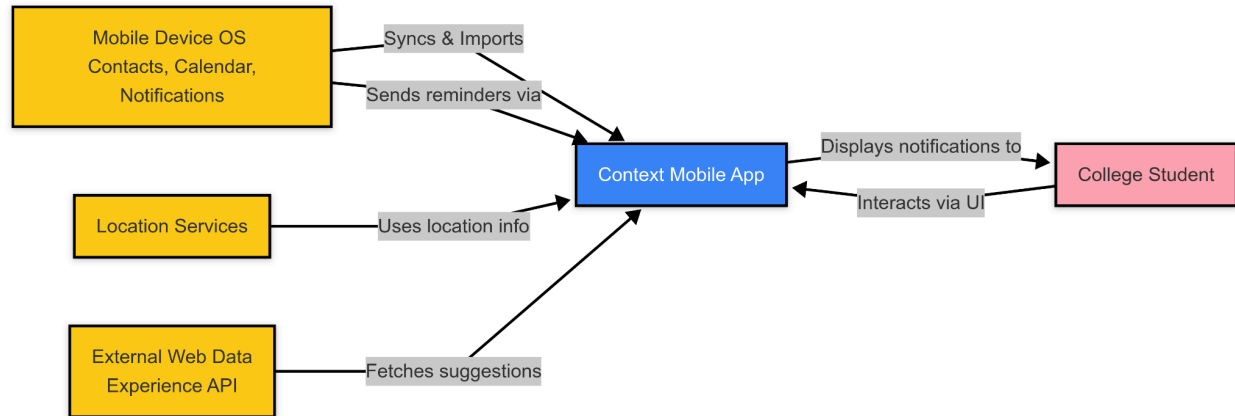

2. User Views

In the appendix.

3. Functional Requirements

ID	Feature	Requirements
F1	Connect with Contacts	As a student, I want to connect with all the people important to me so I can manage my relationships.
F2	Categorize relationships	As a student, I want to categorize my relationships so I can more easily keep track of relationships with the people that matter most.
F3	Home Screen	As a student, I want to see a list of all the people I am chatting with so I can keep track of my conversations with people.
F5	Add relationship context	As a student, I meet many different people so I need a way to keep track of the evolving context of each of my relationships
F6	Chat interface	As a student, I am connected with many people so I need a way to communicate with all these people.
F7	Get reminders for important dates and messages	As a student, I meet many different people and have a hectic schedule so I need to be reminded about important dates and messages.
F8	Get suggestions for experience	As a student, I know many different people and have a busy schedule so I need a way to make plans with people.
F9	Create a digital scrapbook or logbook for every relationship	As a student, I want to remember moments and digitize memories with people important to me.

4. Context View

5. Non-Functional Requirements

ID	Feature Category	Feature	Requirements
NF1	Interoperability	Experiences suggestions	The product should be able to collect information from the web and based on the users' interests suggest experiences for them.
NF2	Compatibility	Connect with Contacts	The mobile application will have the ability to sync with contacts on both Android and iOS devices.
NF3	Responsiveness	Chat interface	The user should be able to see messages within 1ms of the message being sent
NF4	Usability	Connect with Contacts/Categorize relationships/Add relationship context	The product should allow first-time and continuing users to quickly add contacts, categorize relationships and add initial relationship context
NF5	Availability	Maintain relationship context	The app should automatically update the context of each relationship after every interaction.
NF6	Accuracy	Get reminders for important dates and messages	The app should accurately keep track of important dates
NF7	Security	Chat interface	The chat feature of the app will be end-to-end encrypted with only the onboard device AI having access to chat history.

NF8	Privacy		The app will allow users to prevent sharing of data.
NF9	Safety	Get suggestions for experience	The app will make sure not to give suggestions that could put people in harm's way.

4. Customer Value Space

1. Product Features and Benefits

Product Feature	Customer Benefit
Connect with Contacts	Simplifies contact management by automatically syncing contacts, reducing manual entry and improving accessibility.
Categorize Relationships	Organized grouping of contacts (Family, Close Friends, Friends) for targeted communication
Automated Digital Scrapbook	Preserves shared memories and relationship history
Automated Context Tracking & Reminders	Timely, proactive prompts to reconnect with contacts
Chat Interface	Secure, real-time messaging for uninterrupted communication
Automated Experiences Booking	Saves time by automatically finding and scheduling shared experiences, reducing effort in planning meet-ups.
Location Sharing	Real-time location sharing to facilitate quick, hassle-free meet-ups

2. Customer Value Proposition Strategy

Value Proposition Strategy. Select a value proposition strategy for your product using the options that were provided in class. Justify why you chose this strategy and explain how your product's pricing supports this strategy choice.

For Context, a More for More strategy would be the most ideal, because in order to deliver a better product with additional features such as automated experiences booking and AI-based context tracking, we would need to charge users for different features in order to pay for the operational costs of the app. Furthermore, Context will charge users based on the number of contacts added as well as the features used by them, this enables customers to tailor their experience to the app, based on their specific needs. Because, Context aims to differentiate itself and helps its users with the level of automation and contextual reminders, I believe that more for more strategy is most suitable value proposition strategy.

For Context, a More for More strategy emerges as the most optimal approach. To deliver a superior product enriched with advanced features like automated experiences booking and AI-driven context tracking, users will have to be charged appropriately to cover the app's operational costs. By structuring the app's pricing based on both the number of contacts added

and the range of features utilized, customers are enabled to tailor their experience precisely to their needs. This model not only supports the development and maintenance of these cutting-edge functionalities but also reinforces Context's differentiation in the market by offering high-level automation and personalized contextual reminders. Moreover, the premium pricing model drives continuous innovation by reinvesting revenue into further enhancing the product, ensuring that Context consistently remains a top-tier solution in relationship management.

3. Pricing Model

1. Price Setting Strategy

Context will employ a fully usage-based pricing strategy without fixed base subscription fee. Users will incur costs only when they exceed the free usage threshold and if/when they use premium features such as automated experiences booking, ensuring they pay directly for the added value received.

2. Pricing Metric(s)

- Contact-Based Charges: Users can manage up to 150 contacts at no cost. Beyond this threshold, a fee of 5 cents per additional contact per month is charged.
- Automated Experience Booking Charges: Each time a user utilizes the automated experience booking feature, a fixed fee of \$1.00 per booking is applied.

3. Payment Structure

- Frequency: All charges are calculated and billed on a monthly basis.
- Timing: Charges are aggregated and automatically billed at the beginning of each month.
- Method: Payment is processed securely through the in-app payment system.

4. Price

Example for Contact-Based Charges:

If a user manages 200 contacts, the extra charge would be

$$(200 - 100) \times \$0.05 = \$5.00$$

Experience Booking Charge:

Every automated booking incurs a fee of \$1.00 per transaction.

Assumptions & Justification:

- The free threshold of 100 contacts is determined based on typical social network sizes for college students, ensuring that everyday users are not charged while those with larger networks pay proportionally for the added operational costs.
- This usage-based approach directly aligns costs with the value delivered by Context's advanced features, such as AI-based context tracking and automated experience booking, ensuring that customers pay only for what they use.

4. Customer Cost Items

- Direct Monetary Costs:
 - Usage-Based Charges:
 - Contact-Based Charges: Free for the first 100 contacts; after which, a fee of 5 cents per additional contact per month is added.
 - Automated Experience Booking Fee: A fixed fee of \$1.00 per booking is charged for each automated event booking.
 - Transaction Fees: Any applicable taxes and processing fees associated with the in-app payment system.
- Setup and Implementation Costs:
 - App Installation & Onboarding: The time and effort required to download the app, register an account, and sync contacts from various platforms.
 - Initial Configuration: The process of categorizing contacts and personalizing settings to tailor the experience to individual relationship management needs.
- Learning and Maintenance Costs:
 - AI-Training Time: The time investment necessary to understand and effectively use advanced features, such as AI-based context tracking and automated reminders.
- Opportunity Costs:
 - Time and Attention: The commitment of personal time to interact with the app, monitor reminders, and engage with its features instead of using alternative relationship management methods.
 - Cognitive Load: The potential distraction from daily activities due to managing additional notifications and updates from the app.
- Social and Privacy Costs:
 - Data Privacy Concerns: The consideration of sharing personal contact and interaction data with the app, along with potential risks related to data security.
 - Reputation and Social Impact: The minor risk of social discomfort if notifications or reminders are perceived as intrusive or if privacy is inadvertently compromised.

5. Customer Value Proposition Evaluation

Impact:

Context significantly enhances relationship management by automating reminders, curating personalized memories, and streamlining event bookings. This leads to measurable improvements in the frequency and quality of communication, ultimately saving time and fostering stronger relationships

Preference:

Instead of focusing on expanding one's network, Context is designed to deepen and manage existing relationships. Its premium features, like AI-based context tracking and personalized reminders, empower users to prioritize and nurture the bonds they already have, rather than simply expanding the number of connections..

Risk:

Financial risk is low for consumers as they only pay for features that add value to their experience. The transparent, incremental charges, combined with a free trial, allow users to experience the value of Context without a heavy upfront commitment, reducing barriers to adoption. Customers will however be worried about how their data is used to train the AI models that make Context possible.

Alignment:

Context is designed specifically for digitally savvy college students who manage extensive social networks. Its targeted features and flexible pricing model align perfectly with their busy lifestyles and need for efficient, personalized relationship management, making the product an easily justifiable investment.
